4-bit magnitude comparator

HEF4585B MSI

DESCRIPTION

The HEF4585B is a 4-bit magnitude comparator which compares two 4-bit words (A and B), whether they are 'less than', 'equal to', or 'greater than'. Each word has four parallel inputs (A_0 to A_3 and B_0 to B_3); A_3 and B_3 being the most significant inputs. Three outputs are provided; A greater than B ($O_{A>B}$), A less than B ($O_{A<B}$) and A equal to B ($O_{A=B}$). Three expander inputs ($I_{A>B}$, $I_{A<B}$ and $I_{A=B}$) allow cascading of the devices without external gates.

For proper compare operation the expander inputs to the least significant position must be connected as follows: $I_{A=B} = I_{A>B}$ = HIGH, $I_{A<B}$ = LOW. For words greater than 4-bits, units can be cascaded by connecting outputs $O_{A<B}$ and $O_{A=B}$ to the corresponding inputs of the next significant comparator (input $I_{A>B}$ is connected to a HIGH).

Operation is not restricted to binary codes, the devices will work with any monotonic code. The function table describes the operation of the device under all possible logic conditions.

PINNING

A_0 to A_3	word A parallel inputs
B_0 to B_3	word B parallel inputs
$I_{A>B}$, $I_{A<B}$, $I_{A=B}$	expander inputs
$O_{A>B}$	A greater than B output
$O_{A<B}$	A less than B output
$O_{A=B}$	A equal to B output

Notes

1. H = HIGH state (the more positive voltage)
   L = LOW state (the less positive voltage)
   X = state is immaterial

The upper 11 lines describe the normal operation under all conditions that will occur in a single device or in a serial expansion scheme.

The lower 2 lines describe the operation under abnormal conditions on the cascading inputs. These conditions occur when the parallel expansion technique is used.
