

PRODUCT SPECIFICATION

GM76C88 8,192 x 8 BIT STATIC RAM

T-46-23-12

Description

The GM76C88 is 65,536 bit static random access memory organized as 8,192 words by 8 bits using CMOS technology, and operated from a single 5V supply. Advanced circuit techniques provide both high speed and low power features with a maximum operating current of 80mA and minimum cycle time of 70/85/100ns. The combination of speed-optimized circuitry results in a very high-speed memory device. Thus the GM76C88 is suitable for use in various microprocessor application systems where high speed are required. The GM76C88 is offered in 28 pin DIP.

Features

- 8,192 x 8 organization
- High Speed:
Fast Access and Cycle Time 70/85/100ns (max.)
- Low Power Standby and Low Power Operation
- Completely Static RAM: No Clock or Timing Strobe Required
- Common I/O (Three-State Output)
- Directly TTL Compatible: All Inputs and Outputs
- Single +5V Operation ($\pm 10\%$)
- Standard 28 DIP (600 mil)/28 SOP (330 mil)

Pin Name

- $A_0 \sim A_{12}$: Address Input
- \overline{WE} : Write Enable Input
- \overline{OE} : Output Enable Input
- $\overline{CS1}, CS2$: Chip Select Input
- $I/O_0 \sim I/O_7$: Data Input/Output
- V_{CC} : Power Supply, +5V
- GND : Ground

Pin Configuration (Top View)

Absolute Maximum Ratings

Voltage on Any Pin with respect to GND

V _{CC}	-2.0 to 7.0V
Storage Temperature T _{STG}	-55°C to +150°C
Operating Temperature T _{OPR}	0°C to +70°C
Power dissipation P _D	1.0W

Recommended Operating Conditions:

T_A=0°C to +70°C

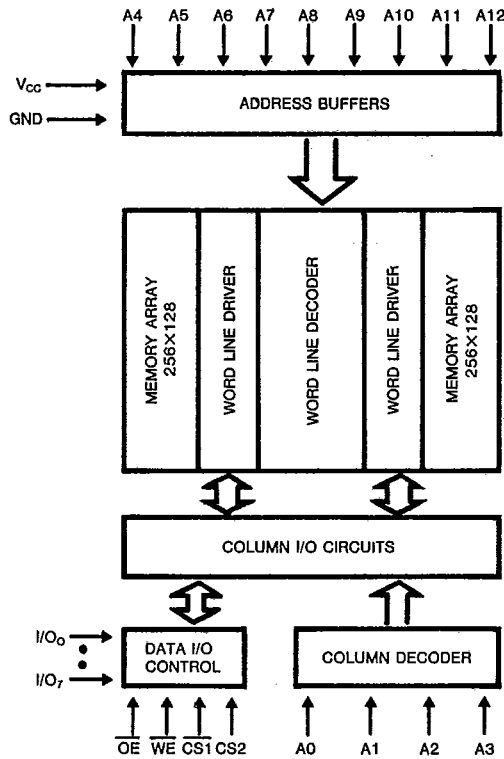

V _{CC} Supply Voltage	4.5 to 5.5V
V _{IH} Input High Voltage	2.2 to 6.0V
V _{IL} Input Low Voltage	-0.5 to 0.8V

All voltages are referenced to GND pin=0V.

Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, It is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high-impedance circuit.

Functional Block Diagram

Truth Table

WE	CS ₁	CS ₂	OE	Mode	I/O PIN	V _{CC} CURRENT	NOTE

GM76C88

T-46-23-12

Timing Waveforms

• READ CYCLE

NOTE: 1) \overline{WE} is high for Read Cycle

• WRITE CYCLE (1) (\overline{OE} clock)

GM76C88

T-46-23-12

• **WRITE CYCLE (2) (\overline{OE} Low Fix)**

- NOTES:
1. A write occurs during the overlap of a low $\overline{CS1}$, a high $CS2$ and a low \overline{WE} . A write begins at the latest transition among $\overline{CS1}$ going low, $CS2$ going high and \overline{WE} going low. A write ends at the earliest transition among $\overline{CS1}$ going high, $CS2$ going low and \overline{WE} going high. t_{WP} is measured from the beginning of write to the end of write.
 2. t_{CW} is measured from the later of $\overline{CS1}$ going low or $CS2$ going high to the end of write.
 3. t_{AS} is measured from the address valid to the beginning of write.
 4. t_{WR1} is measured from the end of write to the address change.
 t_{WR1} applies in case a write ends at $\overline{CS1}$ or \overline{WE} going high.
 t_{WR2} applies in case a write ends at $CS2$ going low.
 5. During this period, I/O pins are in the output state, therefore the input signals of opposite phase to the outputs must not be applied.
 6. If $\overline{CS1}$ goes low simultaneously with \overline{WE} going low or after \overline{WE} going low, the outputs remain in high impedance state.
 7. Dout is the same phase of the latest written data in this write cycle.
 8. Dout is the read data of next address.
 9. If $\overline{CS1}$ is low and $CS2$ is high during this period, I/O pins are in the output state. Therefore, the input signals of opposite phase to the outputs must not be applied to them.

GM76C88

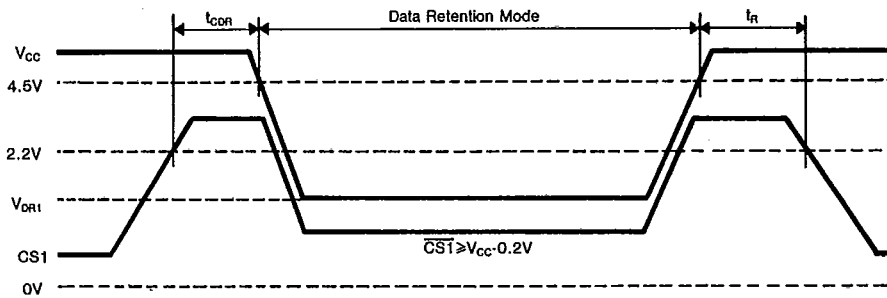

T-46-23-12

Data Retention Characteristics: ($T_A=0^\circ\sim 70^\circ\text{C}$)

SYMBOL	PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{DR}	V_{CC} for Data Retention	V_{DR1}	$\overline{CS1} \geq V_{CC} - 0.2V, CS2 \geq V_{CC} - 0.2V$ or $CS2 \leq 0.2V$	2.0	—	—	V
		V_{DR2}	$CS2 \leq 0.2V$	2.0	—	—	V
I_{CCDR}	Data Retention Current	I_{CCDR1}	$V_{CC} = 3.0V, \overline{CS1} \geq V_{CC} - 0.2V, CS2 \geq V_{CC} - 0.2V$ or $CS2 \leq 0.2V$	—	1	50*	μA
		I_{CCDR2}	$V_{CC} = 3.0V, CS2 \leq 0.2V$	—	1	50*	μA
t_{CDR}	Chip Deselect to Data Retention Time	t_{CDR}	See Retention Waveform	0	—	—	ns
t_R	Operation Recovery Time	t_R		t_{RC}^{**}	—	—	ns

* V_{IL} min = -0.3V, 20 μA max at $T_A=0\sim 40^\circ\text{C}$
 ** t_{RC} = Read Cycle Time

• Low V_{CC} Data Retention Mode: (1) $\overline{CS1}$ Controlled

• Low V_{CC} Data Retention Mode: (2) CS2 Controlled

NOTE: In Data Retention Mode, CS2 controls the Address, \overline{WE} , $\overline{CS1}$, \overline{OE} and D_{in} buffer. If CS2 controls data retention mode, V_{in} for these inputs can be in the high impedance state. If $\overline{CS1}$ controls the data retention mode, CS2 must satisfy either $CS2 \geq V_{CC} - 0.2V$ or $CS2 \leq 0.2V$. The other input levels (address, \overline{WE} , \overline{OE} , I/O) can be in the high impedance state.
