description

The SN54278 and SN74278 each consist of four data latches, full priority output gating, and a cascading gate. The highest-order data applied at a D latch input is transferred to the appropriate Y output while the strobe input is high, and when the strobe goes low all data is latched. The cascading input P0 is fully overriding and on the highest-order package this input must be held at a low logic level. The P1 output is intended for connection to the P0 input of the next lower-order package and will provide a "busy" (high-level) signal to inhibit all subsequent lower-order packages.

After the overriding P0 input, the order of priority is D1, D2, D3, and D4, respectively, within the package.
