## **74HC/HCT4516** Binary up/down counter

Product specification  
File under Integrated Circuits, IC06

December 1990

## Binary up/down counter

## 74HC/HCT4516

## FEATURES

- Output capability: standard
- I<sub>CC</sub> category: MSI

## GENERAL DESCRIPTION

The 74HC/HCT4516 are high-speed Si-gate CMOS devices and are pin compatible with the “4516” of the “4000B” series. They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT4516 are edge-triggered synchronous up/down 4-bit binary counters with a clock input (CP), an up/down count control input (UP/DN), an active LOW count enable input ( $\overline{CE}$ ), an asynchronous active HIGH

parallel load input (PL), four parallel inputs (D<sub>0</sub> to D<sub>3</sub>), four parallel outputs (Q<sub>0</sub> to Q<sub>3</sub>), an active LOW terminal count output ( $\overline{TC}$ ), and an overriding asynchronous master reset input (MR).

Information on D<sub>0</sub> to D<sub>3</sub> is loaded into the counter while PL is HIGH, independent of all other input conditions except the MR input, which must be LOW. When PL and  $\overline{CE}$  are LOW, the counter changes on the LOW-to-HIGH transition of CP. UP/DN determines the direction of the count, HIGH for counting up, LOW for counting down. When counting up,  $\overline{TC}$  is LOW when Q<sub>0</sub> to Q<sub>3</sub> are HIGH and  $\overline{CE}$  is LOW. When counting down,  $\overline{TC}$  is LOW when Q<sub>0</sub> to Q<sub>3</sub> and  $\overline{CE}$  are LOW. A HIGH on MR resets the counter (Q<sub>0</sub> to Q<sub>3</sub> = LOW) independent of all other input conditions.

Logic equation for terminal count:

$$\overline{TC} = \overline{CE} \cdot \{(\overline{UP/DN}) \cdot Q_0 \cdot Q_1 \cdot Q_2 \cdot Q_3 + (\overline{UP/DN}) \cdot \overline{Q_0} \cdot \overline{Q_1} \cdot \overline{Q_2} \cdot \overline{Q_3}\}$$

## QUICK REFERENCE DATA

GND = 0 V; T<sub>amb</sub> = 25 °C; t<sub>r</sub> = t<sub>f</sub> = 6 ns

SYMBOL	PARAMETER	CONDITIONS	TYPICAL		UNIT
			HC	HCT	
t <sub>PHL</sub> / t <sub>PLH</sub>	propagation delay CP to Q <sub>n</sub>	C <sub>L</sub> = 15 pF; V <sub>CC</sub> = 5 V	19	19	ns
f <sub>max</sub>	maximum clock frequency		45	57	MHz
C <sub>I</sub>	input capacitance		3.5	3.5	pF
C <sub>PD</sub>	power dissipation capacitance per package	notes 1 and 2	59	61	pF

## Notes

1. C<sub>PD</sub> is used to determine the dynamic power dissipation (P<sub>D</sub> in μW):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

f<sub>i</sub> = input frequency in MHz

f<sub>o</sub> = output frequency in MHz

∑ (C<sub>L</sub> × V<sub>CC</sub><sup>2</sup> × f<sub>o</sub>) = sum of outputs

C<sub>L</sub> = output load capacitance in pF

V<sub>CC</sub> = supply voltage in V

2. For HC the condition is V<sub>i</sub> = GND to V<sub>CC</sub>  
For HCT the condition is V<sub>i</sub> = GND to V<sub>CC</sub> – 1.5 V

## ORDERING INFORMATION

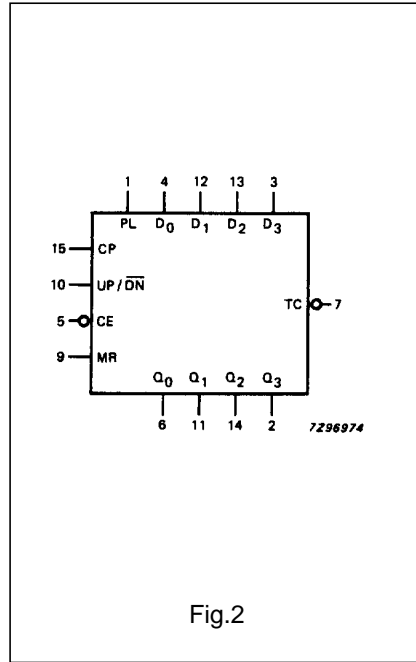

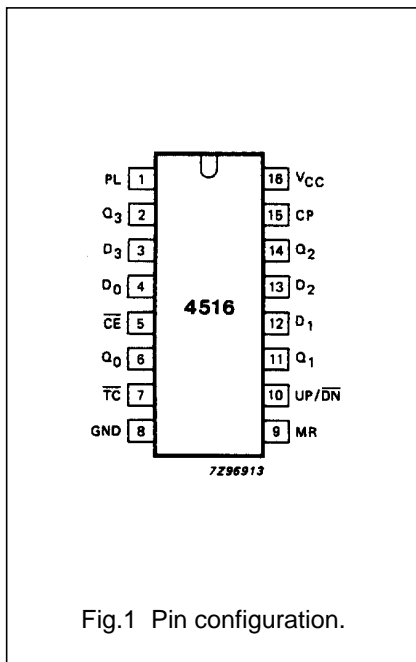

See “74HC/HCT/HCU/HCMOS Logic Package Information”.

Binary up/down counter

74HC/HCT4516

PIN DESCRIPTION

PIN NO.	SYMBOL	NAME AND FUNCTION
1	PL	parallel load input (active HIGH)
4, 12, 13, 3	D <sub>0</sub> to D <sub>3</sub>	parallel inputs
5	$\overline{CE}$	count enable input (active LOW)
6, 11, 14, 2	Q <sub>0</sub> to Q <sub>3</sub>	parallel outputs
7	$\overline{TC}$	terminal count output (active LOW)
8	GND	ground (0 V)
9	MR	asynchronous master reset input (active HIGH)
10	UP/ $\overline{DN}$	up/down control input
15	CP	clock input (LOW-to-HIGH, edge-triggered)
16	V <sub>CC</sub>	positive supply voltage

Binary up/down counter

74HC/HCT4516

Fig.4 Functional diagram.

FUNCTION TABLE

MR	PL	UP/DN	CE	CP	MODE
L	H	X	X	X	parallel load
L	L	X	H	X	no change
L	L	L	L	↑	count down
L	L	H	L	↑	count up
H	X	X	X	X	reset

Notes

1. H = HIGH voltage level  
 L = LOW voltage level  
 X = don't care  
 ↑ = LOW-to-HIGH clock transition

Fig.5 Timing diagram.

## Binary up/down counter

74HC/HCT4516

**DC CHARACTERISTICS FOR 74HCT**

For the DC characteristics see *"74HC/HCT/HCU/HCMOS Logic Family Specifications"*.

Output capability: standard

I<sub>CC</sub> category: MSI

**Note to HCT types**

The value of additional quiescent supply current ( $\Delta I_{CC}$ ) for a unit load of 1 is given in the family specifications.

To determine  $\Delta I_{CC}$  per input, multiply this value by the unit load coefficient shown in the table below.

INPUT	UNIT LOAD COEFFICIENT
D <sub>n</sub>	0.75
PL, $\overline{CE}$	1.00
UP/DN	1.00
CP	1.25
MR	1.50

74HC/HCT4516

APPLICATION INFORMATION

Terminal count ( $\overline{TC}$ ) lines at the 2nd, 3rd, etc. Stages may have a negative-going glitch pulse resulting from differential delays of different 4516s. These negative-going glitches do not affect proper 4516 operation. However, if the terminal count signals are used to trigger other edge-sensitive logic devices, such as flip-flops or counters, the terminal count signals should be gated with the clock signal using a 2-input OR gate such as HC/HCT32.

Fig.12 Cascading counter packages (parallel clocking).

Ripple clocking mode: the UP/DN control can be changed at any count. The only restriction on changing the UP/DN control is that the clock input to the first counting stage must be "HIGH". For cascading counters operating in a fixed up-count or down-count mode, the OR gates are not required between stages and TC is connected directly to the CP input of the next stage with CE grounded.

Fig.13 Cascading counter packages (ripple clocking).

Binary up/down counter

74HC/HCT4516

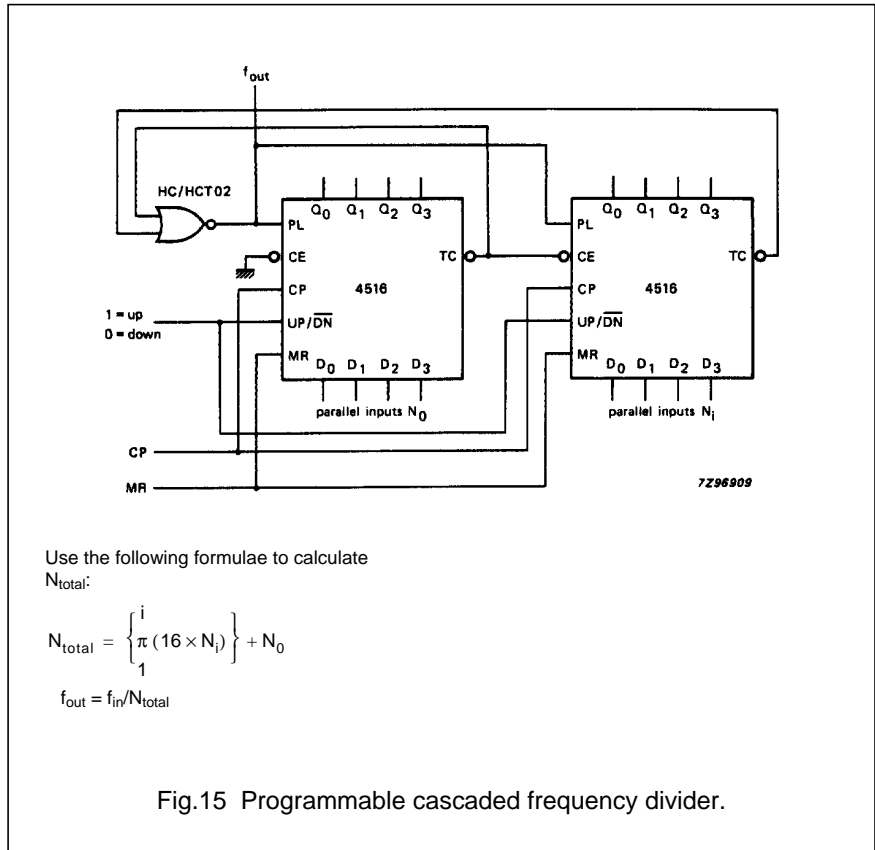

Fig.14 State diagram.

Use the following formulae to calculate  $N_{total}$ :

$$N_{total} = \left\{ \pi (16 \times N_i) \right\}_1^i + N_0$$

$$f_{out} = f_{in} / N_{total}$$

Fig.15 Programmable cascaded frequency divider.

PACKAGE OUTLINES

See "74HC/HCT/HCU/HCMOS Logic Package Outlines".

parallel inputs				count-up	count-down
D <sub>3</sub>	D <sub>2</sub>	D <sub>1</sub>	D <sub>0</sub>	n	n
0	0	0	0	15	(1)
0	0	0	1	14	1
0	0	1	0	13	2
0	0	1	1	12	3
