The TAA320 is a silicon monolithic integrated circuit, consisting of a MOS transistor and an n-p-n transistor in a TO-18 metal envelope.

The device is primarily intended for audio amplifiers with a very high input resistance (e.g. for crystal pick-ups).

Besides this application the TAA320 is also suitable for other applications where a high input resistance is required, like impedance converters, timing circuits, microphone-amplifiers, etc.

To exclude the possibility of damage to the gate oxide layer by an electrostatic charge building up on the high resistance gate electrode, the leads of the device have been short circuited by a clip. The clip has been arranged so that it need not be removed until the device has been mounted in the circuit.

1)  $-V_{GS}$  decreases about 6 mV/ $^\circ\text{C}$  with increasing ambient temperature at a constant  $-I_D$ .

### Mounting instruction for BD115

Proper continuous operation is ensured up to  $T_{amb} = 50$  °C, provided the BD115 is directly mounted on a 1.5 mm blackened Al. heatsink of  $30 \text{ cm}^2$  with a clamping washer of type 56218.

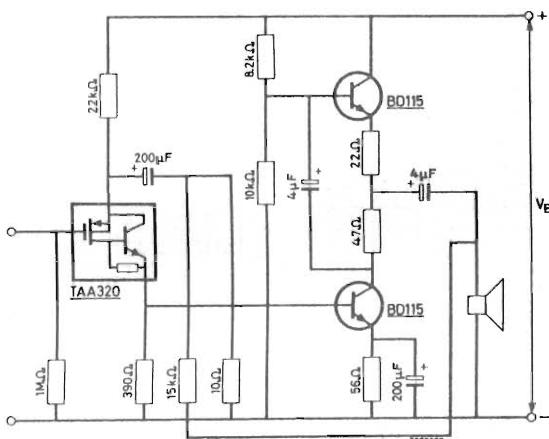

If the transistor is mounted on a heatsink with a mica washer, the heatsink should have an area of  $50 \text{ cm}^2$ .

Recommended diameter of hole in heatsink: 7.7 mm.
