REVISED DECEMBER 1983

- Fully Buffered to Offer Maximum Isolation from External Disturbance
- Package Options Include Both Plastic and Ceramic Carriers in Addition to Plastic and Ceramic DIPs.
- Dependable Texas Instruments Quality and Reliability

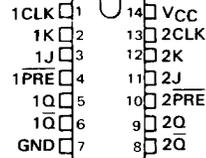

## description

These devices contain two independent J-K negative-edge-triggered flip-flops. A low level at the preset input sets the outputs regardless of the levels of the other inputs. When preset (PRE) is inactive (high), data at the J and K inputs meeting the setup time requirements are transferred to the outputs on the negative-going edge of the clock pulse. Clock triggering occurs at a voltage level and is not directly related to the rise time of the clock pulse. Following the hold time interval, data at the J and K inputs may be changed without affecting the levels at the outputs. These versatile flip-flops can perform as toggle flip-flops by tying J and K high.

The SN54LS113A and SN54S113 are characterized for operation over the full military temperature range of -55°C to 125°C. The SN74LS113A and SN74S112 are characterized for operation from 0°C to 70°C.

† For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions.

‡ All typical values are at V<sub>CC</sub> = 5 V, T<sub>A</sub> = 25°C.

§ Not more than one output should be shorted at a time, and the duration of the short circuit should not exceed one second.

NOTE 2: With all outputs open, I<sub>CC</sub> is measured with the Q and  $\bar{Q}$  outputs high in turn. At the time of measurement, the clock input is grounded.

NOTE 4: For certain devices where state commutation can be caused by shorting an output to ground, an equivalent test may be performed with V<sub>O</sub> = 2.25 V and 2.125 V for the 54 family and the 74 family, respectively, with the minimum and maximum limits reduced to one half of their stated values.
