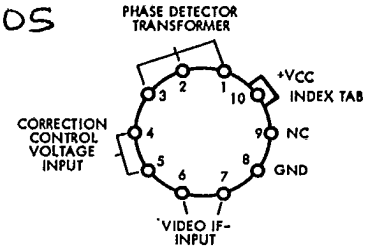
ECG711

WIDE-BAND AMPLIFIER/PHASE DETECTOR WITH ZENER DIODE VOLTAGE REGULATOR

semiconductors

T-77-07-05

For AFC (Automatic Frequency Control) Applications

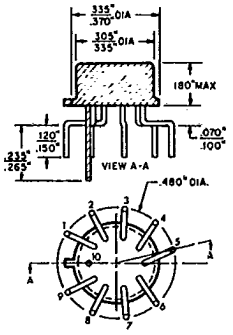


DESCRIPTION

The ECG 711 represents a second generation of integrated circuit designed primarily for AFC (Automatic-Frequency-Control) applications.

The ECG 711 features an internal zener regulated power supply.

The ECG 711 is supplied with formed leads for easier PC board design and construction.



FEATURES

- Differential Input Amplifier/Limiter
- Full-Wave Diode Bridge Detector
- Differential Output Voltage Amplifier
- Wide Operating Temperature Range; -55 to +125°C

ABSOLUTE-MAXIMUM RATINGS

DISSIPATION:
- At T_A = 25°C . . . . . 830 mW
- Above T_A = 25°C. . . . Derate linearly 5.6 mW/°C

TEMPERATURE RANGE:
- Operating . . . . . -55°C to +125°C
- Storage . . . . . -65°C to +200°C

DYNAMIC CONTROL VOLTAGE CHARACTERISTICS

The ECG 711 is specifically intended for use in the AFT system of color television receivers. The device is tested so that the control voltages generated by the circuit meet the critical requirements of the system. Figure 5 is the schematic diagram of the test circuit.

Figure 6 and 7 show the control voltages generated at terminals 4 and 5 of the Integrated Circuit as a function of the frequency deviation from the nominal center frequency. Figure 6 shows the region within 25 KHz of the center frequency while Figure 7 covers the entire bandwidth of the system. The horizontal reference lines on the figures are generated by a voltage divider connected between the power supply voltage on Terminal 10 and ground. The dynamic control voltages are compared with these references according to the Output vs Frequency Deviation Table. For example: when the frequency deviation is -25 KHz the control voltage at Terminal 4 is greater than the reference A voltage; the control voltage at Terminal 5 is less than the reference B voltage.

The shape of the correction voltage characteristics is dependent to a large degree upon transformer characteristics and the parts layout.

MAXIMUM VOLTAGE RATINGS at T_A = 25°C

The following chart gives the range of voltages which can be applied to the terminals listed vertically with respect to the terminals listed horizontally. For example, the voltage range between vertical terminal 2 and horizontal terminal 6 is +20 to 0 volts.

TERMINAL No.	9	10	1	2	3	4	5	6	7	8
9	NO INTERNAL CONNECTION									-
10			+20 0	+20 -10	+20 0	+20 0	+20 0	+20 0	+20 0	▲
1				*	+12 -12	*	*	+6 -6	*	+6 0
2					*	*	*	+20 0	*	+20 0
3						*	*	+6 -6	*	+6 0
4							*	*	*	+12 0
5								*	*	+12 0
6									+5 -5	+5 0
7										+8 -5
8										REF. SUB-STRATE

MAXIMUM CURRENT RATINGS

TERMINAL No.	I_{IN} mA	I_{OUT} mA
9	-	-
10	50	50
1	5	5
2	20	20
3	5	5
4	5	5
5	5	5
6	5	5
7	5	5
8	50	50

▲ Terminal No. 10 may be connected to any positive voltage source through a suitable dropping resistor—provided the dissipation rating is not exceeded.

* Voltages are not normally applied between these terminals. Voltages appearing between these terminals will be safe if the specified limits between all other terminals are not exceeded.

DEFINITIONS OF TERMS

Input Limiting Voltage (Knee) [v_i(lim)]

The input signal voltage which will cause the output signal to decrease 3 dB from its maximum level.

Total Device Dissipation (P_T)

The total power drain of the device with no signal applied and no external load current.

Quiescent Operating Voltage

The dc voltage at the output terminal, with respect to ground, with no signal applied.

Quiescent Operating Current

The average (dc) value of the current in either output, terminal, with no signal applied.

Output Offset Voltage

The dc voltage between output terminals with no signal applied.

Control Voltage

The dc voltage at either output terminal with respect to ground with an RF signal of specified frequency applied.
